

Shared Team Schedules

Problem & Goals

Problem

Each user configures their own recurring reports. This causes duplication (multiple team members scheduling the same report), inconsistency (misaligned timings), and missed opportunities (reports not reaching stakeholders automatically).

Goals

- Enable **team admins/owners** to create and manage shared schedules.
- Allow **recipients** to inherit schedules seamlessly without duplicating configuration.
- Provide clear **metadata visibility** into who owns the schedule, and who the recipients are.
- Reduce redundant schedules and improve **team-level efficiency**.

Non-Goals

- Not redesigning the scheduler service end-to-end.
- Not addressing advanced recurrence (covered in Custom Recurrence change).
- Not automating dynamic role-based scheduling beyond explicit owner → recipients mapping.

Users & Scenarios

Primary User: Team Admin / Report Owner

- Wants to configure a recurring report once and share with multiple teammates.

Secondary User: Report Recipients

- Needs to receive the shared reports automatically and view metadata of ownership.

Scenarios:

1. A team admin sets up a monthly performance report and shares it with 5 team members → all 5 get notifications.

2. An owner deletes the shared schedule → recipients stop receiving updates.
3. A recipient views the report detail → metadata shows “Shared by [owner]” and the list of recipients.

Proposed Change (Functional Spec)

Introduce **Shared Team Schedules**:

- **Creation Flow:**
 - Owner configures schedule and selects “Share with team members” option.
 - UI exposes recipient picker (email addresses / team roles).
- **Metadata & Discovery:**
 - Report detail view shows “Shared by [owner]” + recipient list.
 - Search index supports queries by recipient.
- **Notifications:**
 - All recipients receive scheduled emails; deletion cancels all notifications.
- **Editing & Permissions:**
 - Only owners can edit or delete a shared schedule.
 - Recipients have read-only visibility.

Constraints

- Must integrate with existing **ACL system** to avoid leaks.
- Metadata contract must include `owner_id` and `recipient_ids`.
- Search index must refresh within <15 mins for visibility changes.

Acceptance Criteria

1. **Creation:** Shared option visible during scheduling; recipient picker works.
2. **Notifications:** Recipients listed receive all scheduled emails.
3. **Deletion:** Removing schedule stops notifications for all recipients.

4. **Metadata:** Detail view shows “Shared by [owner]” + recipients.
5. **Permissions:** Only owner can edit/delete.
6. **Scalability:** Support up to 100 recipients without performance degradation.

Metrics

- Reduction in duplicate schedules for same report (>30%).
- Increase in team-wide adoption of reporting (>20%).
- 100% alignment between metadata visibility and actual email delivery.
